Cross-matching:

CDC	Yes ☐	No ☐
Flow cytometry	Yes ☐	No ☐
ELISA	Yes ☐	No ☐
Bead array	Yes ☐	No ☐

A - GENERAL POLICIES
B - PERSONNEL QUALIFICATIONS
C - QUALITY ASSURANCE
C4.000 Quality Assurance.

C4.100 **External Proficiency Testing(EPT) and Competency Evaluation.**

C4.110 The laboratory must participate in EPT programme(s) to cover all the accredited laboratory applications (HLA typing, antibody screening and identification, crossmatching, etc.). EPT results must be obtained for all techniques individually or in combination as routinely used to produce a final result. The procedure for testing EPT samples including the allocation to techniques must be documented prior to the annual commencement of the EPT cycle.

C4.120 For proficiency testing, the laboratory must be in compliance with published regulations formulated by the EFI EPT Committee and approved by the EFI Board.

K - DISEASE ASSOCIATION

K3.100 **Typing for a single allele-group by molecular techniques (e.g. HLA-B*27).**

K3.110 Where typing for a single allele-group is performed a positive control DNA known to encode the allele-group of interest must be included in each test.

K3.120 Where typing for a single allele-group is performed a negative control DNA known not to encode an allele belonging to the allele-group of interest must be included in each test.

L – NUCLEIC ACID ANALYSIS

L1.0000 General laboratory design, equipment and reagents.

L1.2000 **Contamination control (″wipe-test″).**

L3.2550 Databases of HLA sequences used for allele assignment must be accurate and updated at least each year.

Standards for PROVIDERS of External Proficiency Testing (EPT) schemes – Version 5.0.

8 DNA-based EPT

8.1 For all DNA based EPT (low or high resolution) the HLA typing accepted by the EPT Provider is designated as the correct result.

IMGT/HLA Database

Release 3.4.0, 08 April 2011

The IMGT/HLA Database provides a specialist database for sequences of the human major histocompatibility complex (HLA) and includes the official sequences for the WHO Nomenclature Committee For Factors of the HLA System. The IMGT/HLA Database is part of the international ImMunoGeneTics project (IMGT).

The database uses the 2010 nomenclature designations in all tools. To aid in the adoption of the new nomenclature, all search tools can be used with both the current and pre-2010 allele designations. The pre-2010 nomenclature designations are only used where older reports or outputs have been made available to download.

UMCG laboratoriumgeneeskunde

Consequences of used primer sets in testing HLA-B*27; results and (non-) learning aspects of a national SKML Quality Survey

H.H.M. Eidhof, B.G. Hepkema, S.P.M. Lems*, J. Danneberg, R. Maatman (klin lab ZGT Hengelo, *UMCG Groningen)*

Introduction

An external quality assurance program for HLA-B*27 by Molecular Biological techniques, twice a year, is operational since 1997 in The Netherlands. Most participants use Sequence Specific Primers (SSP) as described previously by Olerup et all (exon 2) or Dominquez et all (exon 3). Due to the 'all or none respons' type of this technique, co-amplification of a control- gene (eg HGH) is essential. Reported results of the participants have a high degree of consensus but occasionally there are exceptions. We observed this phenomenon two times, in a survey in 2007 and in a survey in 2008. Since 2007, all our survey-samples are typed for HLA-B by sequencing based typing (SBT) to obtain a high resolution. The use of the right primer sets, in combination with a recent HLA allele database (http://www.ebi.ac.uk/imgt/hla/) is important to get the right results.

Method

Blood or purified DNA samples were sent to 34 participants in The Netherlands. Participants used their in-home standard method to analyse the material for HLA-B*27. Results were compared by the distributing laboratory of the Ziekenhuis Groep Twente (Almelo/Hengelo). SBT of the survey was performed, by the UMCG laboratory (Groningen, Holland). The reactivity of the published primer sets were updated with the most recent allele database (v 2.23.0) table 1. Results were presented in a biannual meeting of the CMBD task force.

Results

In the sent out 2007.1, there appeared a great difference between the participants, in the results of the HLA-B*27 typing. Sequencing by the expert laboratory (UMCG), revealed that this patient was HLA-B*1802, 4002.

20 out of 26 laboratories (77%), qualified this material falsely as positive for HLA-B*27.

In the 2008.2 survey, material was used of a patient that was sequenced by the expert laboratory as HLA-B*1802,1501. 14 out of 34 laboratories (41%), reported (false) positive results for HLA-B27. In this sent out there were 13 participants who scored falsely positive in the 2007 sent out and now again failed.
